Acknowledgement

Before we get into thick of things, we would like to add few words of appreciation for the people who have been a part of this project right from its inception. The writing of this project has been one of the significant academic challenges we have faced and without the support, patience and guidance of the people involved, this task would not have been completed. It is to them I owe my deepest gratitude.

It gives us a great pleasure in presenting this project report of “Studio Management System”. It has been our privilege to have a team of project guide who have assisted us from the commencement of this project .The success of this project is a result of this sheer hard work, and determination of us with the help of our project guide. We hereby take this opportunity to add a special note of thanks to Mr. AmilaSiriwardana who undertook to act as our mentor despite his many other academic and professional commitments. His wisdom, knowledge, and commitment to the highest standards inspired and motivated us. Without his insight, Support and energy, this project wouldn’t have kick-started and neither would have reached fruitfulness.

We also feel heartiest sense of obligation to Mr.A.T. Selvam, the staff members & seniors and who helped us in collection of data & resource material & also in its processing as well as in drafting manuscript. The project is dedicated to all those people, who helped us while doing this project.

Our thanks and appreciation also goes to all the group members and those who supported us beyond their capacity to make this project a success.

Abstract

The digital revolution is far more significant than the invention of writing or even of printing.

The above quote was stated by Douglas Engelbart. As we are living in the information era we all know the computer systems are the most reliable and accurate systems that fulfills the quotidian activities of the human race. The time is precious. Therefore saving time is a challenge these days. The computer systems that have been replaced most of organizations shows better results in almost all the ways compared to human systems.

The studio management system that we developed to Kandy Films Asgiriya is a great opportunity that we got our lives. Until recently they used a manual system. Mostly they were using a single diary to keep records of all the events that they were covering. After the software was developed and a database is also attached they have found it so easy to keep records and to maintain their studio.

Background and Project

Need for this Project

This Project is the result of the knowledge that was gained from our 06-month learning at E-SOFT from the modules that are required for the Diploma in Information Technology.

We look forward demonstrating our organizing, technical skills, project management knowledge, time management, team work, software management, logical as well as some creative thinking by undertaking a disciplined work to cater for a real world scenario by developing a suitable software system of an acceptable scope.

We decided developing software to the Kandy films studio - asgiriya. We believe by doing this software, we will not only able to improve and develop our knowledge and skills in this field, but can help the client in overcoming the difficulties that are experiencing by them.

Objectives of the project

1. To implement the knowledge gained in E-Soft.
2. To provide a better system to maintain accounting records.
3. To help clients to overcome their present difficulties.
4. To help clients to complete their work with ease and short period

Outline and Description of the purpose

The basic objective of the Studio Management System is to replace the existing written system into a computer based system, so that the user will be able to perform tasks related to studio with much easily. Besides that the new software will help to complete work within a short period, and information stored in the system will be safe. The software can be edited, view and delete information related to customers, staff and videos, etc. It can also update information of booking or cancelling videos. Furthermore, it has a login address with password which will help to use only by selected users, which is required for maintaining safety of the information stored in the system.

Scope of the project

1. To make the existing system more efficient.
2. To provide a user friendly environment where user can be serviced better.
3. Make functioning of studio faster.
4. Provide a system where the staff can catch defaulters and not let them escape.

Feasibility Analysis

It is wise to think about the feasibility of any problem we undertake. Feasibility is the study of impact, which happens in the organization by the development of a system. The impact can be either positive or negative. When the positives nominate negatives, then the system is considered feasible. Here the feasibility can be performed in two ways such as Technical and Economical feasibility.

Technical feasibility

Generally there is not being much difficulty in getting required resources for the development and maintaining of a system. All resources for the development of the software as well as the maintenance of the same are available in the organization. Here we are utilizing only the resources which are available already.

Economical feasibility

Development of an application is highly economically feasible. The organization does not need to spend much for the development of the system. They need to only make an environment with an effective supervision. If the task is given to us, we can attain the maximum usability of the corresponding resources. Even after the development, the organization will not be in a condition to invest more in the organization. Therefore, the system can be called as economically feasible.

1. The system is not cost effective.
2. The benefits do not outweigh cost.
3. Since it is user friendly, the cost of full system study will be less.
4. No cost for hardware, since we use the available hardware.
5. Cost of software development and package software will not be necessary, since we do it free of charge.

Analysis Report

Existing System

The client faces difficulties in maintaining accounts records, since all records related to studio are updated manually, as you know it is very complicating handling accounts records manually, as it requires each entry for each video. There would have been occasions where records have been misplaced, skipped, destroyed or have been incorrectly recorded. It is not an easy task to find such missing records, and to add, remove, or edit manually. Furthermore during the time of handing over of such responsibilities to another person, it takes a very long time in explaining the current method of records. Misinformation or false references might lead to serious setback.

1. When a video booked by a person, details of such information are registered in a book manually.
2. The information of the project will also be written in a book.

Problems encountered

1. Lack of safety.
2. Mistakes while recording.
3. Too many paper recording which leads to loss of documents
4. Large space for storing such paper records
5. Poor data storage.
6. Slow on retrieval of data.
7. Time consuming.
8. Often loss of data recording sources.

Our system compared to existing

All videos booking in the existing system are done manually, which takes more timing. Other major disadvantages are time consuming on arranging the details according to the customer requirement, which at present is carried out as a one day process for verifying such records. So after conducting the feasibility study it was decided to take the manual studio management system to be computerized.

The studio management system created by us is completely user friendly software. It helps to overcome all the difficulties and problems that are faced by the existing system in maintaining studio records. Editing of any previously encoded records which is presently done by handwriting will now be computerized by creating this studio management system software.

The proposed system is an automated studio management system, in which the user can add, edit, save and retrieve information of videos and photos of a particular customer in a simple and quick way. In addition our proposed system has the following advantages:

- Secured login system
- User friendly interfaces
- Fast access to database
- Less errors
- Look and feel environment

All difficulties that are faced by manually managing the studio record has now been rectified by implementing computerization system.

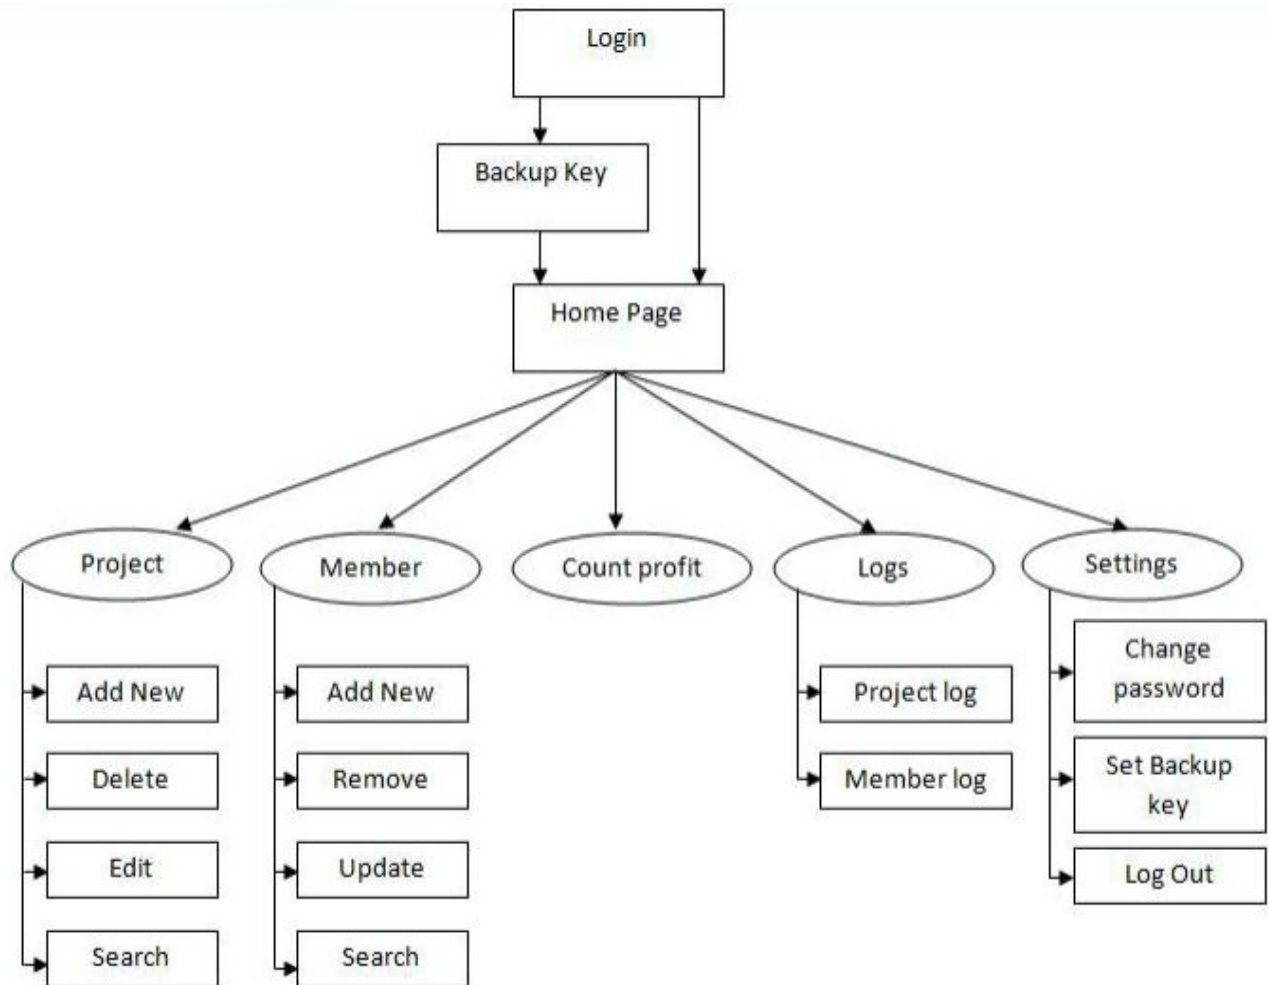

Fact finding techniques to gather requirements

During our survey in finding the requirements of the client, we used a question and answer technique. This helped us to get clear idea as how the software should be developed according to the client requirements. The questions that were placed are as follows:

1. What is the current system you are using to record information?
2. What are the problems you face with your existing system?
3. Would you prefer to use a computerized system to maintain records?
4. What type of a system will be essential at the moment?
5. How will a computerized system help you to overcome the problems faced by your current system?

```

Data table structure

1. Login table

dbo.Tablelog: Table(admin-pc\2ee6d374-ff8e-4d.K:\NEW\NEW\MAIN.MDF)

	Column Name	Data Type	Allow Nulls
▶	username	varchar(50)	<input type="checkbox"/>
	password	varchar(50)	<input type="checkbox"/>
	backupkey	int	<input type="checkbox"/>
			<input type="checkbox"/>

2. Project table

dbo.tablepro: Table(admin-pc\2ee6d374-ff8e-4d.K:\NEW\NEW\MAIN.MDF)

	Column Name	Data Type	Allow Nulls
▶	projectno	int	<input type="checkbox"/>
	date	varchar(50)	<input type="checkbox"/>
	event	varchar(50)	<input type="checkbox"/>
	hotel	varchar(50)	<input type="checkbox"/>
	cn	varchar(50)	<input type="checkbox"/>
	pac	int	<input type="checkbox"/>
	advance	int	<input type="checkbox"/>
	allbata	int	<input type="checkbox"/>
	othercost	int	<input type="checkbox"/>
	contact	varchar(50)	<input type="checkbox"/>
			<input type="checkbox"/>

3. Member table

dbo.member: Table(admin-pc\2ee6d374-ff8e-4d.K:\NEW\NEW\MAIN.MDF)

	Column Name	Data Type	Allow Nulls
▶	num	int	<input type="checkbox"/>
	name	varchar(50)	<input type="checkbox"/>
	gender	varchar(50)	<input type="checkbox"/>
	dob	date	<input type="checkbox"/>
	age	int	<input type="checkbox"/>
	address	varchar(MAX)	<input type="checkbox"/>
	nic	varchar(50)	<input type="checkbox"/>
	tp1	varchar(50)	<input type="checkbox"/>
	tp2	varchar(50)	<input checked="" type="checkbox"/>
	email	varchar(50)	<input checked="" type="checkbox"/>
	sal	int	<input type="checkbox"/>
			<input type="checkbox"/>

Testing Reports

System Requirements

Hardware Requirements

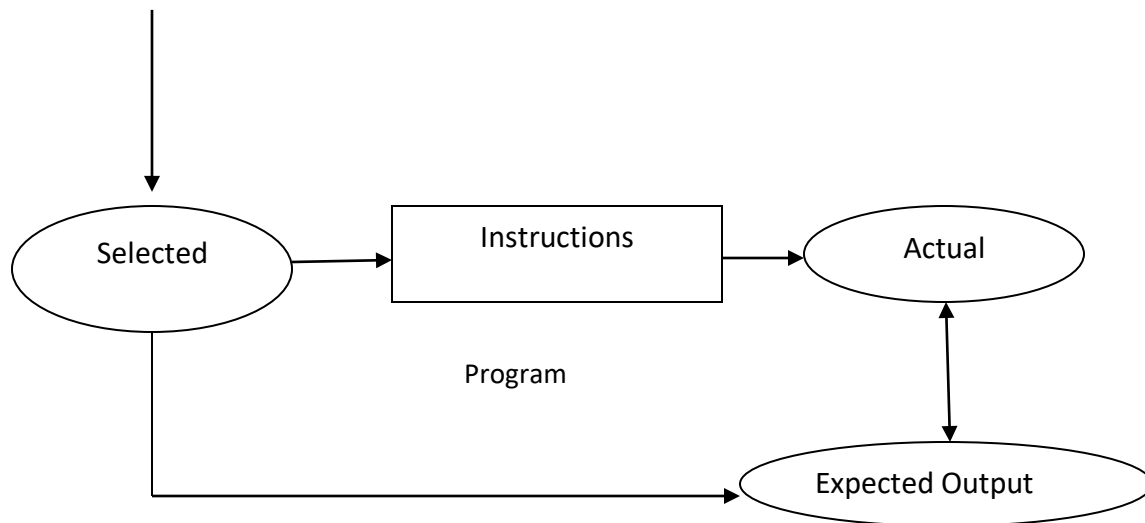

- Processor : Pentium IV or better
- RAM : 1GB or more
- Hard disk : 20GB
- Monitor : any
- Keyboard : any

Software Requirements

- Operating system : Windows 98, Windows XP, Windows 7 Or better
- Language : c#
- Black End : SQL server

Black Box Testing

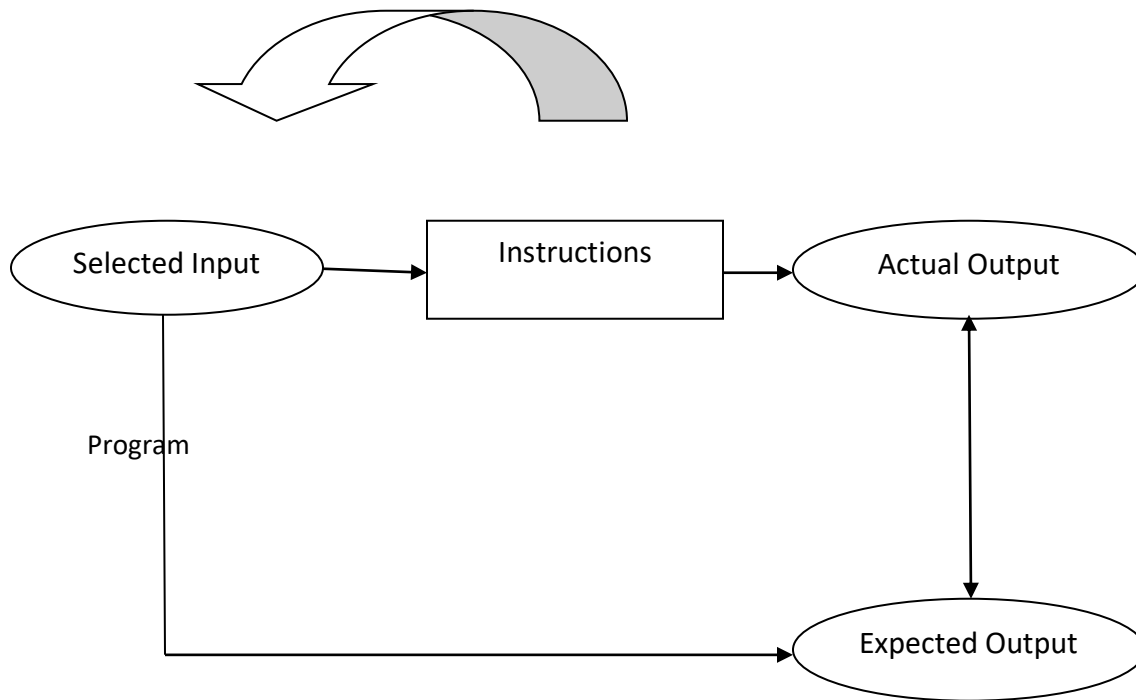

Program Specification

In this approach the program is assumed to be a black box where the processing logic unit cannot be seen. This means that what is happening inside the program is not important to the person who is carrying out the testing. The tester is worried about the output that the program produces. Therefore, the aim of testing is to check whether the program produces the correct output for every single input.

Test data are selected based on the program specification and not based on the logic of the program. Therefore, some of the logical pathway may be missed with the chosen test data.

White Box Testing

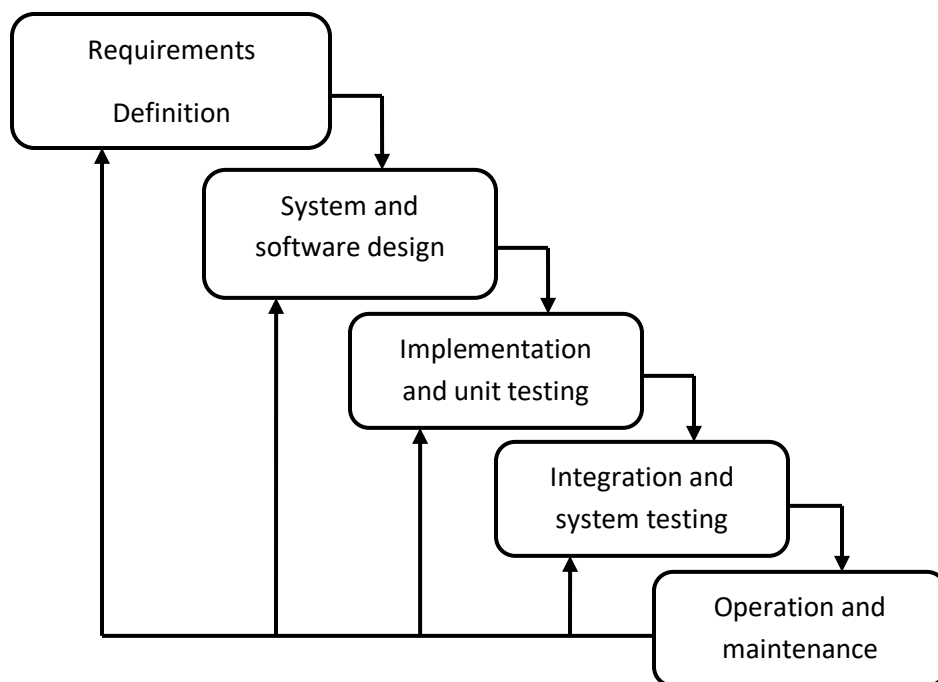

Here the program is assumed to be a transparent box where the logic in it is seen by the tester, that means the processing logic is considered important in this method therefore testing is carried out to check whether the input are driven correctly by the logic and as a result correct outputs are obtained.

Test data are selected based on the logic. Or the program to test each and every possible logical pathway.

Application Maintenance and agreements with client

- Longest life circle phase
- The system is installed and put into practical use.
- Maintenance involves correcting errors which are not discovered in earlier stage of life cycle, improving the implementation of system units and adding the system requirements as new requirements are discovered.
- This involves activities like staff training, file conversation (turning manual files into computer files), site preparation, preparing user manuals and possibly some parallel running.

Client agreement letter

KANDY FILMS (PVT) LTD.

Address: No.29/A/1/1, Sri Sumangala Mw,
Asgiriya, Kandy.
Tel : 0773-495760, 0812060202

The Manager,
Esoft Metro Campus,
Diploma Division,
Mulgampola,
Kandy.
03-06-2016

Dear Sir,

Approving a request of Ditec Students of Esoft Metro Campus Kandy

This is to certify that our company named, Kandy Films have decided to give the approval for Udith Weerasinghe and the group in 56th Ditec batch of Esoft Metro Campus to develop a Software for our company by using our accounting details.

A. S. Ambagaspiya
Director
Kandy Films (Pvt) Ltd
